

API: Raphael

Original at <https://flutter.dev/go/template>

SUMMARY

Raphael is the code name for a complete LMS and Web-API. The overall goal of the document is to achieve proper understanding and use of the API given by Management.

For contact and technical support for the infrastructure provided contact the given information here provided

WHAT PROBLEM IS THIS SOLVING?

The project is a greenfield rework to the entire IT infrastructure of the technological backbone for an out of date k-12 institution, the executive and technical goals is the total support and assistance for the day to day task in the operative duties.

Alongside closing the gate between parents and alumni for all members of the institution, therefore facilitating the overall connection of the aforementioned to the operational support of our members.

Objectives of the discussion or design.

SYSTEM OVERVIEW:

The overall System architecture is going to be a mixed React/TS Frontend framework with a C#/.Net Backend. For the database a combination of MySQL and Docker.

A standard overall Mind map of each one of the mayor conjuncts.

INTENDED USERS:

- Administrative Personnel:
 - Role: Operative Associate.
 - Level of Expertise: Moderate, likely needed onboarding and guidelines for use.
 - Access Authority: Students Academical Data, Databases, Teacher's resources, Tickets, Chronogram.
- Teachers :
 - Role: Operative Associate.
 - Level of Expertise: Moderate, likely needed onboarding and guidelines for use.
 - Access Authority: Students Academical Data, Databases, Teacher's resources, Tickets, Chronogram.
- Representants:
 - Role: Client.
 - Level of Expertise: Null, only comercial Frontend needs.
 - Access Authority: Personal Data, Students Resources Tickets, Chronogram.
- Students:
 - Role: Client.
 - Level of Expertise: Null, only comercial Frontend needs.
 - Access Authority: Personal Data, Students Resources Tickets, Chronogram.

- Guests/ Future Clients:
 - Role: Client.
 - Level of Expertise: Null, only commercial Frontend needs.
 - Access Authority: Personal Data, Students Resources Tickets, Chronogram.

Suggestions to Protocol and UX experience:

- The dev team settled for Darkmode for the student portal and light for the client facing UX to manage eye strain and direction of attention.
- Re-Routing with react needed and likely will create a child dependency in Hooker for the Routing guides .

BACKGROUND

The economical status of the country as registered in Apr 15 2026, the overall market stabilization and current lack of qualified personnel has opened a opportunity for investment and future advance in a local niche.

Under such premise understanding the current technological offset for the nation has opened the local opportunity for a stable market edge due to technological lead between our entity in relationship with the rest of nearby institutions.

Audience

Target Goal: Attention and Capture of local middle income basis in nearby markets with an iprovement in operations

Glossary

- **Terms Relevant to Discussion** - A minimal set of definitions of terms needed to understand the problem domain go here. Do not include widely known concepts (e.g. don't define "URL" or "GUI"), just things needed to understand the discussion.

OVERVIEW

Overview of the design or discussion.

Non-goals

What is specifically not being addressed by this discussion or design.

USAGE EXAMPLES

How would the user experience the proposed solution? Provide a few examples illustrating how the user will use the proposed solution in realistic scenarios. If the proposal is an API, include sample code in accordance with [Flutter's style guide](#). Include brief inline explanations of key concepts this proposal introduces. If applicable, show before-and-after comparisons. Here is an example for your reference:

- [GoRouter API improvements \(PUBLICLY SHARED\)](#)

If the proposal is a GUI or CLI, include a detailed description of each usage scenario. You're

also encouraged to include [paper sketches](#), [wireframes](#) or [storyboards as visual aid](#). It's completely fine to keep them at a low fidelity (e.g., paper-based) to facilitate discussions. Here is an example for your reference:

- [scenario description][Detect Memory Leaks \(PUBLICLY SHARED\)](#)

You may integrate usage examples into the Detailed Design/Discussion section if doing so makes your doc flow better. However, mark them clearly with subsection headings, so a reader who doesn't wish to review the implementation can still provide feedback on the intended usage of your proposed solution.

DETAILED DESIGN/DISCUSSION

Current file Architecture and Structure

ACCESSIBILITY

Explain how accessibility needs will be addressed by the proposal.

INTERNATIONALIZATION

Explain how internationalization and localization needs will be addressed by the proposal.

INTEGRATION WITH EXISTING FEATURES

Explain how existing features are affected by the proposal. How will you adjust existing APIs and features so that in the end, the combined API feels like it was always designed to have the proposed feature?

OPEN QUESTIONS

- Will it work?

TESTING PLAN

Provide a description of testing or a link to a testing plan here, if the discussion involves something that can be tested.

DOCUMENTATION PLAN

Provide a description of the planned documentation and code samples that will be provided for the implementation, both for the API documentation and for any specialized articles for the website.

MIGRATION PLAN

Provide a description of the migration plan or a link to a migration plan here, if the discussion involves something that must be migrated.
